

What is ISDN PRIME

What would I use it for? ISDN PRIME is most advantageous in saving space and hardware costs in PBX systems. One Card (instead of 3) accommodates 23 channels of demand regulated incoming and outgoing traffic freeing up hardware requirements.

How many lines do I get with one ISDN PRIME? 23 lines of DID/BWT trunks.

What are the advantages of ISDN PRIME in DID applications? DID and Outgoing Traffic lines require dedicated ports in your PBX. All 23 channels of an ISDN PRIME line are not only capable of Both-Way and Direct Inward Dialing traffic, they are also self regulating, automatically giving you the type of service you need.
